WHAT'S NEW in this issue?

AFRICAN REGION

Egypt

- Confirmed H5N1 HPAI outbreaks in poultry (Giza and Menofia)

ASIAN REGION

China (Province of Taiwan)

- Confirmed H5N2 avian influenza in poultry (Penghu County)
- Confirmed H5N2 LPAI avian influenza in poultry (Chia-I)

Indonesia

- Suspected H5N1 HPAI outbreak in poultry (Central Java)

NOTE: UPDATED INFORMATION IS INDICATED IN RED

AFRICAN REGION

Egypt

OFFICIAL

27/11/12 – Confirmed H5 HPAI outbreaks in poultry, Giza and Menofia (FAO Field Officer)

Between 8 and 27 November 2012, H5 HPAI was detected in three live-bird markets in unvaccinated poultry: one in Menofia (turkeys) and two in Giza (ducks) Governorates. The outbreaks were detected by active surveillance.

ASIAN REGION

Bangladesh

OFFICIAL

19/11/12 – Confirmed H5N1 HPAI outbreak in poultry, Dhaka (OIE – World Organization for Animal Health)

The H5N1 HPAI outbreak previously mentioned by media (reported in the weekly HPAI update N. 551) which occurred on 23 October 2012 in a commercial poultry farm in the Pabur Village in Kapasia Upazila, Gazipur District, Dhaka Division, was reported to the OIE. A total of 156 poultry, out of a

susceptible population of 4 191, died, and the remaining population was destroyed.

China

OFFICIAL

23/11/12 – Confirmed H5N2 avian influenza in poultry, Province of Taiwan – Pengu Country (Bureau of Animal and Plant Health Inspection and Quarantine)

On 22 November 2012, the presence of avian influenza H5N2 was detected on an indigenous chicken farm in Penghu County during seasonal active surveillance. Although only nucleic acid of the virus was detected, the county government started culling before the results of the pathogenicity tests were completed. The clinical and epidemiological investigations of surrounding poultry farms within a three-km radius found no suspected cases.

http://www.baphiq.gov.tw/newsview.php?menu=1054&typeid=1056&news_id=6986

23/11/12 – Confirmed H5N2 low pathogenic avian influenza in poultry, Province of Taiwan – Chia-I (Bureau of Animal and Plant Health Inspection and Quarantine)

On 22 November 2012, the presence of avian influenza H5N2 LPAI was detected on a 15 700 bird layer chicken farm in Pu-Zih, Chia-I, from samples taken during seasonal active surveillance and identified as the H5N2 strain by virus isolation. Movement restriction was implemented on the infected farm. Clinical and epidemiological investigation in the infected farm was done and the result showed that the layers were in healthy condition without a drop of egg production. The positive results of serological, virological tests and analyzed data of gene sequencing confirmed this H5N2 outbreak as LPAI. The clinical and epidemiological investigations of surrounding poultry farms were conducted. Note by the OIE Animal Health Information Department: H5 and H7 avian influenza in its low pathogenic form in poultry is a notifiable disease as per Chapter 10.4. on avian influenza of the Terrestrial Animal Health Code (2012).

NON-OFFICIAL

27/11/12 – Suspected H5N2 avian influenza in poultry, Province of Taiwan (Media)

An outbreak of avian influenza was reported for the first time in Penghu in a poultry farm on 22 November 2012; 600 chickens were culled (the official report is listed above). The report states that on 19 November 2012, 150 native chickens died on a farm. The farmer took sick and dead chickens to the Penghu Livestock Disease Control Inspection for testing. The test results of 22 November 2012, were positive for H5N2. It will take two days to identify if this avian influenza is LPAI or HPAI. The chicken farms within a three km radius will be under movement control for 21 days. If the results indicate HPAI, the birds in this radius will be culled. Clinical signs of avian influenza have not yet been found in farms around the infected farm.

Indonesia

OFFICIAL

18/11/12 – Suspected H5N1 HPAI outbreaks in poultry, Central Java, Yogyakarta (FAO Field officer)

Suspected outbreaks of H5N1 HPAI have been observed in several districts of Central Java and Yogyakarta, notably affecting young ducks (< four weeks old). In some cases, mortality is reported to have reached 90% in this age group. Clinical signs include incoordination, torticollis and decreased egg production in adult ducks. H5 has been identified by PCR testing and virus isolates are undergoing further characterisation. The mortality rates in the population of young ducks is higher than previously encountered with H5N1 HPAI viruses in Indonesia, and may suggest changes in the circulating virus. Virus sequencing is currently underway.

NON-OFFICIAL

26/11/12 – Suspected H5N1 HPAI outbreak in poultry, Central Java (Media)

An outbreak of H5N1 HPAI reoccurred in Winton, in Ngelo Hamlet, Semin Village, Nguntoronadi District, Wonogiri Regency, Central Java, affecting 700 ducks of which 200 died.

Highly Pathogenic Avian Influenza H5 confirmed outbreaks

29 May - 29 November 2012

CONTACTS

The HPAI Situation Update compiles data on Highly Pathogenic Avian Influenza outbreaks. It is updated weekly, published in PDF format and automatically sent by email to a list of subscribers. We have received many requests to join the *HPAI Situation Update* distribution list. While we highly value the growing interest and wider distribution, it is hard for us to manage the increasing list of contacts. We would therefore appreciate if the contacts in each organisation/country could forward the document to all relevant people within their organisation/country.

The ECTAD HPAI Situation Update has been prepared by the EMPRES (Emergency Prevention Programme for Transboundary Animal Diseases) / GLEWS (Global Early Warning for Major Animal Diseases, including Zoonoses) team of the Animal Production and Health Division of the Food and Agriculture Organization of the United Nations.

Additional information on the outbreaks can be found in EMPRES-i (<http://empres-i.fao.org/>). Electronic version of the maps can be found on the website at http://www.fao.org/ag/againfo/programmes/en/empres/maps_new.html

For further information about the FAO HPAI Situation Update please contact the EMPRES/GLEWS team of FAO GLEWS@fao.org

DISCLAIMER

FAO compiles information from numerous sources (FAO representatives or country missions, FAO reports, OIE, official government sources, European Commission, **FAO** reference centres, laboratories and FAO collaborators) and produces these composite maps in a representative effort to provide full and accurate information.

FAO welcomes information to clarify disease or infection occurrence in areas that have not been properly depicted (with supporting documentation to make the required changes based on FAO validation and verification procedures). If you want to share relevant information on animal diseases events with GLEWS please send messages to GLEWS@fao.org

MAP: The maps represent occurrences of confirmed or suspected cases of H5 and H5N1 reported over the last 30 days (1st map) and last six months (2nd map). H5 cases are represented for countries where N-subtype characterization is not being performed for secondary cases or when laboratory results are still pending. The original data have been collected and aggregated at the most detailed administrative level.

TEXT: The text represents information obtained within the past 14 days indicating the original date of reporting or publishing of the information. Sources of information are included for easy reference. FAO does not guarantee the accuracy of non-official reports.

TABLES: The outbreaks presented in the tables are referring to the observation date (or the earliest clinical date known) and reported date of the first and last occurrence of an outbreak/case in a country. The affected populations refer to all populations ever affected. The reported date is the date when the occurrence of a disease has been confirmed by an official source. Outbreak of disease or infection means the occurrence of one or more cases of a disease or an infection in an epidemiological unit.
